

ROPE ACCESS

Rope Access is a service that allows employees to access heights and confined areas using a secure, two-rope system. Once in place, Brock's Rope Access solution offers facility owners another proven safe, efficient and cost-effective method for executing maintenance, turnaround and capital projects. In recent months, Rope Access is also being used as a means to complete work on sites where headcounts are lower and social distancing guidelines are being enforced due to COVID-19.

Cost Effective

Rope Access is an economical solution to provide access to hard to reach places. It requires fewer personnel to complete tasks in an efficient way, which in turn translates to minimal downtime, increased production, and increased profits for the client.

Time Reducing

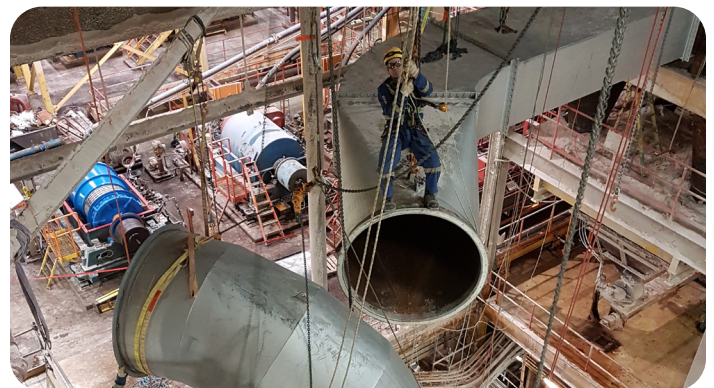

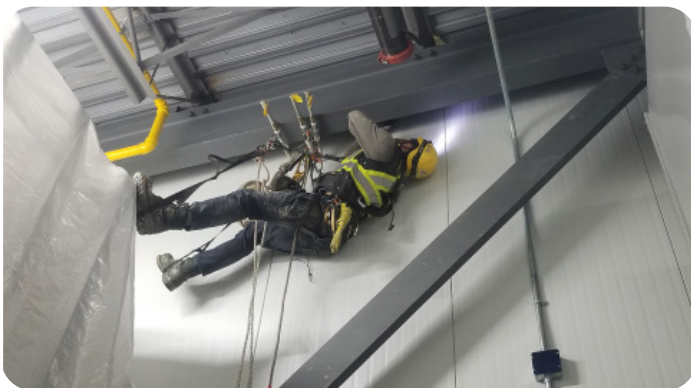

Rope access systems are installed and removed in an efficient manner compared to traditional access methods. It requires less interference with other facility operations, meaning less disruptions, minimized downtime, and a safer work environment for all personnel.

Safety

Our rope access program and technicians uphold an exceptional safety record which has resulted in our work being classified as one of the safest in the whole construction industry. We place a high focus on the identification and implementation of dropped object controls, safe systems of work, rope access rescue plans and other procedures to maintain our incident and injury free status.

Reduced Work Hours

When comparing rope access to traditional access methods, the work hours required to complete the same tasks are significantly reduced.
